

London Garage Cleaning Business Opportunity Analysis

Step-by-Step Data Analytics Report

Prepared for: Afridi Islam

Tools: Google Sheets, Google BigQuery SQL, Tableau

Process: Ask, Prepare, Process, Analyze, Share, Act

Project Purpose

This project uses a London housing dataset to evaluate where to launch a garage cleaning and organization business. The analysis focuses on identifying properties and neighborhoods with garages, then converting those findings into practical marketing and business actions.

Executive Summary

This project analyzed 1,000 London residential properties to evaluate the opportunity for launching a garage cleaning and organization business. The business concept is to help homeowners clean and organize garage spaces while promoting reuse by reselling, donating, or responsibly redirecting unwanted items with the owner's permission.

The analysis found that 501 out of 1,000 properties have garages, meaning 50.1% of the sampled properties are potential customers. Kensington, Notting Hill, and Westminster were identified as the strongest initial target neighborhoods, while detached house owners were identified as the most promising customer segment.

Metric	Result
Total houses analyzed	1,000
Houses with garages	501
Garage ownership rate	50.1%
Top neighborhood by garage count and concentration	Kensington
Primary target property type	Detached House
Average price - with garage	£1,881,849.19
Average price - without garage	£1,799,600.87

Phase 1 - Ask

Business Problem

Many London homeowners have garages that are underused or filled with unwanted items accumulated over time. This creates a potential opportunity for a garage cleaning and organization service. The business would charge for cleaning and tidying garages, while also supporting sustainability by reusing or reselling unwanted items that customers no longer need.

Before launching, the key business question is where to start. The analysis therefore focuses on identifying neighborhoods and property types with the strongest concentration of garage-equipped homes.

Business Objective

Identify the most promising London neighborhoods and customer segments for launching a garage cleaning and organization business.

Key Business Questions

- How many houses have garages?
- What percentage of houses have garages?
- Which neighborhoods have the highest number of houses with garages?
- Which neighborhoods have the highest percentage of houses with garages?
- Which property type is most likely to have a garage?
- Do houses with garages have higher average property values?

- Do houses with garages tend to be larger?
- Which locations and customer segments should be prioritized for launch?

Stakeholders

The main stakeholder is Afridi Islam as the future business owner. Secondary stakeholders include homeowners, local communities, buyers of reusable second-hand items, and sustainability-focused groups interested in reducing waste.

Phase 2 - Prepare

Dataset Overview

Attribute	Details
Dataset source	Kaggle London housing dataset
Rows	1,000
Columns	17
File type	CSV
Geographic focus	London residential properties

Column List

#	Column
1	Address
2	Neighborhood
3	Bedrooms
4	Bathrooms
5	Square Meters
6	Building Age
7	Garden
8	Garage
9	Floors
10	Property Type
11	Heating Type
12	Balcony
13	Interior Style
14	View
15	Materials
16	Building Status
17	Price

Relevant Variables for the Business Objective

Column	Reason for Use
Neighborhood	Identifies the best areas to target for marketing.
Garage	Primary variable for identifying potential customers.
Property Type	Helps define the ideal customer segment.
Square Meters	Tests whether larger properties are more likely to have garages.
Building Age	May support future hypotheses about clutter accumulation.

Price	Helps evaluate whether garage owners belong to higher-value property segments.
Garden	Useful context, although it is not the same as shed ownership.

Dataset Suitability and Limitation

The dataset is suitable for analyzing garage availability by neighborhood, property type, price, and property size. However, it does not include a Shed column, so the analysis cannot directly answer how many houses have sheds. Any shed-related conclusions would require another dataset or additional field collection.

Phase 3 - Process

The dataset was inspected in Google Sheets before analysis. This phase focused on validating quality rather than transforming the data.

Validation Check	Result
Missing values	None found
Duplicate records	None found
Inconsistent categorical values	None found
Invalid numeric values	None found
Garage/Garden values	Consistent Yes/No in spreadsheet; imported as Boolean in BigQuery

Because the dataset was clean, no rows were removed and no correction was required. This differs from the previous Airbnb project, where cleaning was necessary before analysis.

Phase 4 - Analyze

The Analyze phase used Google BigQuery SQL to answer the business questions. The analysis was intentionally focused on SQL concepts already learned: SELECT, FROM, WHERE, COUNT, SUM, AVG, ROUND, CAST, GROUP BY, and ORDER BY.

Business Question 1 - How many houses have a garage?

```
SELECT COUNT(*) AS houses_with_garage
FROM `circular-more-business-idea.london_houses.london_houses_data`
WHERE Garage = TRUE;
```

Metric	Result
Houses with garages	501
Total houses	1,000
Garage percentage	50.1%

Business insight: Approximately one out of every two residential properties in the dataset has a garage. This indicates a sizeable potential market for the proposed business.

Business Question 2 - Which neighborhoods have the highest number of houses with garages?

```
SELECT
    Neighborhood,
    COUNT(*) AS houses_with_garage
FROM `circular-more-business-idea.london_houses.london_houses_data`
WHERE Garage = TRUE
GROUP BY Neighborhood
ORDER BY houses_with_garage DESC;
```

Rank	Neighborhood	Houses with Garages
1	Kensington	62
2	Notting Hill	52
3	Westminster	52
4	Camden	51
5	Greenwich	51
6	Soho	50
7	Marylebone	49
8	Shoreditch	46
9	Chelsea	44
10	Islington	44

Business insight: Kensington has the largest absolute number of properties with garages, followed by Notting Hill and Westminster. These areas are strong candidates for initial marketing because they contain many potential customers.

Business Question 3 - Which neighborhoods have the highest garage concentration?

```
SELECT
    Neighborhood,
    COUNT(*) AS total_houses,
    SUM(CAST(Garage AS INT64)) AS houses_with_garage,
    ROUND(
        SUM(CAST(Garage AS INT64)) * 100.0 / COUNT(*),
        2
    ) AS garage_percentage
FROM `circular-more-business-idea.london_houses.london_houses_data`
GROUP BY Neighborhood
ORDER BY garage_percentage DESC;
```

Rank	Neighborhood	Total Houses	Houses with Garage	Garage %
1	Kensington	114	62	54.39%
2	Notting Hill	96	52	54.17%
3	Westminster	98	52	53.06%
4	Greenwich	97	51	52.58%
5	Soho	96	50	52.08%
6	Shoreditch	89	46	51.69%
7	Camden	106	51	48.11%
8	Chelsea	94	44	46.81%
9	Islington	97	44	45.36%
10	Marylebone	113	49	43.36%

Business insight: Kensington is strongest because it has both the highest count and highest percentage of garage-equipped properties. Notting Hill and Westminster are also strong secondary launch areas.

Business Question 4 - Which property type is most likely to have a garage?

```
SELECT
    Property_Type,
    COUNT(*) AS total_houses,
    SUM(CAST(Garage AS INT64)) AS houses_with_garage,
    ROUND(
        SUM(CAST(Garage AS INT64)) * 100.0 / COUNT(*),
        2
    ) AS garage_percentage
FROM `circular-more-business-idea.london_houses.london_houses_data`
GROUP BY Property_Type
ORDER BY garage_percentage DESC;
```

Property Type	Total Houses	Houses with Garage	Garage %
Detached House	349	191	54.73%
Semi-Detached	345	172	49.86%
Apartment	306	138	45.10%

Business insight: Detached house owners are the strongest customer segment, followed by semi-detached house owners. Apartments should be a lower priority for initial targeting.

Business Question 5 - Do houses with garages have higher property values?

```
SELECT
    Garage,
    ROUND(AVG(Price), 2) AS average_price
FROM `circular-more-business-idea.london_houses.london_houses_data`
GROUP BY Garage;
```

Garage	Average Property Price
With Garage	£1,881,849.19
Without Garage	£1,799,600.87
Difference	£82,248.32

Business insight: Properties with garages have a higher average property value. This does not prove that garages cause higher prices, but it suggests that garage owners may be a higher-value customer segment for premium organization services.

Business Question 6 - Do houses with garages tend to be larger?

```
SELECT
    Garage,
    ROUND(AVG(Square_Meters), 2) AS average_house_size
FROM `circular-more-business-idea.london_houses.london_houses_data`
GROUP BY Garage;
```

Garage	Average House Size
With Garage	151.08 m ²
Without Garage	148.17 m ²
Difference	2.91 m ²

Business insight: Garage-equipped homes are slightly larger on average, but the difference is small. Property size alone should not be used as the main targeting criterion.

Analyze Phase Summary

- 50.1% of sampled properties have garages, suggesting strong market potential.
- Kensington, Notting Hill, and Westminster are the best launch neighborhoods based on garage count and concentration.
- Detached houses are the strongest target property type.
- Garage homes have higher average property values, supporting a premium service positioning.
- Property size has only a minor relationship with garage ownership.

Phase 5 - Share

The Share phase converted SQL findings into a Tableau dashboard designed to support quick business decision-making. The dashboard title was "Garage Cleaning Business Opportunity in London".

Dashboard Design

Dashboard Element	Purpose
Total Houses KPI	Shows total sample size.
Houses With Garage KPI	Shows potential customer count.
Garage Percentage KPI	Shows market penetration.
Average House Price KPI	Shows value of the target property segment.
Top Neighborhoods Chart	Identifies where to start marketing.
Property Type Chart	Identifies the best customer segment.
Average Property Size Chart	Compares house size by garage availability.
Average Property Price Chart	Shows property value difference by garage availability.

Final Dashboard Screenshot

Key Findings Presented in the Dashboard

- There is a meaningful market because 501 of 1,000 sampled houses have garages.
- Kensington is the strongest launch neighborhood in the dataset.
- Detached houses are the best target customer segment.
- Garage-equipped properties have a higher average value than homes without garages.
- The business can be positioned around cleaning, organization, reuse, and sustainability.

Phase 6 - Act

The Act phase converts analytical findings into a practical launch strategy for the garage cleaning and organization business.

Recommended Actions

Action	Rationale
Launch first in Kensington	It has both the highest garage count and highest garage concentration.
Expand next to Notting Hill and Westminster	Both have high garage counts and high garage percentages.
Target detached house owners	Detached homes have the highest garage percentage and largest count of garage homes.
Position service around sustainability	Reuse and resale of unwanted items creates differentiation and environmental value.
Offer tiered packages	Basic, Standard, and Premium options can serve different customer budgets.

Build online presence	Google Business Profile, social media pages, and before/after photos can build trust.
-----------------------	---

Suggested Service Packages

Package	Possible Services
Basic	Garage cleaning, sweeping, simple organization.
Standard	Cleaning, organization, waste sorting, responsible disposal.
Premium	Full organization, item categorization, resale/donation support, before/after documentation.

KPIs to Track After Launch

- Number of customers per month
- Revenue by neighborhood
- Average job value
- Customer satisfaction
- Repeat customer rate
- Referral count
- Number of reusable items recovered
- Marketing conversion rate

Future Data Requirements

- Shed availability
- Garage size and condition
- Owner vs renter status
- Household income estimates
- Customer interest or booking data
- Marketing response data
- Service duration and profitability by package

Project Conclusion

This project demonstrates how data analytics can evaluate a real business idea. Using Google Sheets for preparation and validation, BigQuery SQL for analysis, and Tableau for communication, the project identified a practical launch strategy for a garage cleaning and organization business in London. The strongest recommendation is to begin marketing to detached house owners in Kensington, then expand to Notting Hill and Westminster.

Appendix - SQL Query Reference

Market size - houses with garages

```
SELECT COUNT(*) AS houses_with_garage
FROM `circular-more-business-idea.london_houses.london_houses_data`
WHERE Garage = TRUE;
